

Background & Motivation

- OOD detection is crucial for real-world applications like healthcare and autonomous vehicles. Traditional methods lack generalizability, especially in large, pre-trained models like CLIP.
- Existing CLIP-based OOD methods require complex fine-tuning or underperform in zero-shot settings due to domain mismatch, highlighting the need for a training-free approach that preserves model integrity.

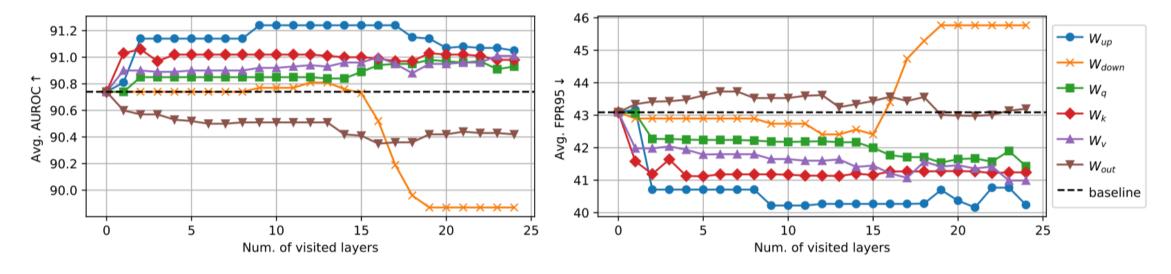

Research Gap

- Zero-shot methods: Limited by domain gaps, reducing performance.
- Fine-tuning methods: Risk disrupting pretrained representations.
- CNN post-hoc methods: Rely on distinct activation patterns for ID/OOD • SeTAR+FT: A fine-tuning extension, freezes major components and data, which doesn't applied to large-scale pre-trained models such as CLIP. tuning minor ones, enabling parameters-efficient fine-tuning.

Greedy Search Algorithm

Develop a rank reduction ratio for each layer to optimize detection performance.

- 1. Enumerate all vision encoder layers and then text encoder layers.
- 2. Apply different rank reduction ratio to the linear matrix.
- 3. Select the rank reduction ratio candidate with minimum loss.
- Wup is the most effective matrix across all linear weight matrices.

SeTAR: Out-of-Distribution Detection with Selective Low-Rank Approximation

Key Contribution

• A training-free OOD detection approach using <u>SVD-based Selective Low-</u> **<u>Rank Approximation</u>** to enhance performance without additional training. • Achieves SOTA results on ImageNet1K and Pascal-VOC benchmarks, outperforming existing zero-shot and fine-tuning methods.

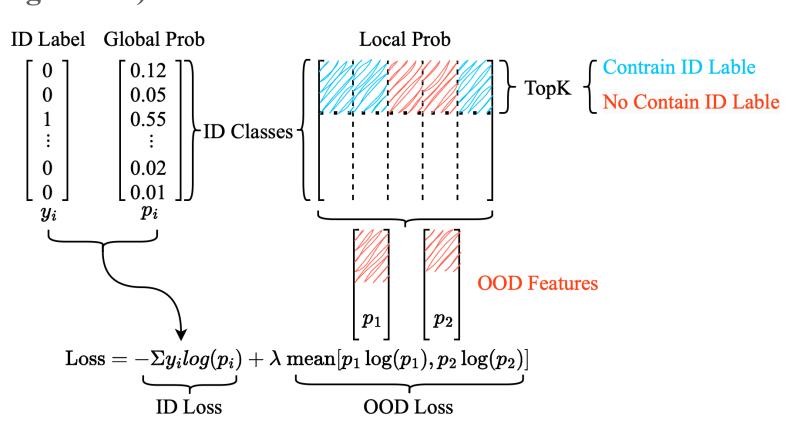

SeTAR Overview

- Low-Rank Approximation: Retains critical model weights by discarding minor singular components.
- Greedy Search: Optimizes rank reduction layer-by-layer, targeting linear matrix Wup for maximum impact.

Loss Function

Pushes OOD samples far from ID samples while keeping ID samples close.

• Key Challenges: OOD images are unavailable during searching. • Main Idea: Create pseudo OOD features with ID-irrelevant nuisances (e.g., backgrounds) in CLIP's local features.

LoRA*	
SeTAR+FT	

1. <u>Training-Free (SeTAR)</u>: Achieves state-of-the-art zero-shot OOD detection across different backbones (CLIP-base, CLIP-large, Swin-base) and various score functions (MCM, GL-MCM, MSP, Energy) on ImageNet1K and VOC. 2. <u>Fine-Tuning (SeTAR+FT)</u>: Outperforms existing fine-tuning methods (LoCoOp, LoRA) with faster convergence, superior OOD detection, and higher classification accuracy, especially on challenging datasets.

3. <u>Image Classification Accuracy</u>: Maintains or further enhances image classification performance while strengthening OOD detection capabilities. 4. <u>Near-OOD Effectiveness</u>: SeTAR and SeTAR+FT perform well even on challenging near-OOD tasks, confirming robustness.

5. <u>Pruning Strategies</u>: Discarding minor singular values optimally enhances **OOD** detection by preserving critical components.

6. <u>Modality Impact</u>: Vision modality yields the best gains; combining vision and text maximizes results.
